A.I. use disclosure

Artificial intelligence (AI) was utilized in the preparation of this work solely as a collaborative tool to verify chemical structures, check molecular formulas, and ensure technical accuracy. Specifically, AI assisted in confirming atomic compositions, valence checks, ring counts, and double-bond totals across the ten-molecule progression.

Additionally, AI supported the compilation and formatting of structural metadata, including condensed structural formulas, Lewis representations, and bond-line structures. All final outputs and chemical details were reviewed and validated to maintain academic integrity and precision.
